Areas of Interest / Specialization				
Crop Biotechnology, Genetics and Genomics, Bioinformatics				
<p>Our laboratory uses a combination of genetic, genomic and transgenic technologies to study the molecular basis of important agronomic traits in two different oilseed crops, <i>Brassica juncea</i> (Indian mustard) and <i>Carthamus tinctorius</i> (Safflower). In mustard, we work on (i) identification of genes influencing traits of economic value viz., seed size and oil content using a comparative genomics approach and their validation using transgenic technology and expression studies and (ii) transgenic approaches for introducing resistance to mustard aphid (<i>Lipaphis erysimi</i>) using a combination of lectin genes and RNAi strategies. Our research on safflower is in collaboration with two other faculty members of the Department of Botany. Earlier work on safflower in our laboratory focused on analysis of genetic diversity and population structure of the crop, development of core collections and panels for association mapping. Current thrust areas of safflower research in our lab include development of molecular markers, generation of mapping populations for construction of linkage maps, genetic dissection of important traits and genetic transformation for crop improvement. Additionally, our group is also involved with next generation sequencing-based generation of transcriptome resources for the mustard aphid.</p>
